

## Gherkin statements: Using a computer running the Linux operating system

**Scenario:** User locking the screen

**Given** that a user wants to secure their system upon walking away from their desk

**When** a user presses Ctrl + Alt + L

**Then** the user will be prompted to re-enter their login details.

**Scenario:** User accessing privileged directory

**Given** that any non-root user wants to access root system files

**When** a user uses the **sudo** command in the terminal

**Then** block the user's access and write a "Permission Denied" error message.

**Scenario:** User running a Python script from the terminal

**Given** the user has a Python script called "test.py"

**When** the user runs the command "python test.py" whilst in the file directory

**Then** the script should execute

**And** display its output in the terminal
